COMP2401—Tutorial 4
ASCII code, Strings and Arrays

Learning Objectives

After this tutorial, you will be able to

- Use the ASCII code table
- Check if a string is a palindrome
- Define and use arrays

Submit your tutorial in a tar file (t4.tar)

And here is a program (prtASCII.c) that prints out the table:

```
#include <stdio.h>

int main()
{
    int i;

    for( i=0 ; i<=127 ; i++ ) /*ASCII values ranges from 0-127*/
    {
        printf("ASCII value of character %c = %d\n", i, i);
    }

    return 0;
}
```

Try it. Why does this work given that we are printing out the **same** variable 'i' twice and getting two different things – a character and a numeric code?

Task 1: Write a program – nameToASCII.c – that reads a name and prints the corresponding ASCII code for each letter.

Task 2: A palindrome is a word that reads the same from front and back. Write a program (you can start with palindrome.c) to detect if a word is a palindrome or not. Your program should interact with a user as follows:

```
Enter a word or "q" to stop: something
           "something" is not a palindrome
Enter a word or "q" to stop: kayak
            "kayak" is a palindrome
Enter a word or "q" to stop: q
```

2 Arrays

Read the code in array.c. If something is not clear look at Chapter 2.5 "Arrays" (p71-74).

Task 3: Initialize the arrays from array.c with some values of your choice.

Task4: Add a variable rowSums that's an array of int (int rowSums[3];) and write code that would put the sum of each of the rows of array2d[3][4] in the corresponding index of rowSums and then print it.

3 Submission

Submit your tutorial work (nameToASCII.c, palindrome.c and array.c) in a tar file!
